

Memorandum

To: Program Projects and Operations Subcommittee
From: Lori Laster, Stormwater Management Engineer
Date: March 29, 2010
Re: Stormwater Best Management Practices Program FY2011 Applications

The District received 7 applications for Fiscal Year 2011 for the Stormwater Best Management Practices Program.

City of Omaha – Benson Rain Garden Initiative – The City of Omaha will construct a bio-infiltration garden on the Benson Magnet High School Campus. They are requesting a cost share of \$10,000, the maximum of this program.

City of Omaha – Orchard Park Bio-Retention Garden – The City of Omaha will construct a bio-retention garden in Orchard Park as part of the Cole Creek Restoration Project. They are requesting a cost share of \$10,000, the maximum of this program.

City of Omaha – Pervious Pavement Bridge Embankments – The City of Omaha will install pervious concrete slab on the east side of the trail under the Blondo Street Bridge over West Papillion Creek and the trail along Big Papillion Creek near the 105th Street Bridge. They are requesting a cost share of \$10,000, the maximum of this program.

City of Omaha – Johnny Goodman Golf Course Bio-Retention Garden – The City of Omaha will construct a bio-retention garden on the Benson Johnny Goodman Golf Course. They are requesting a cost share of \$10,000, the maximum of this program.

Millard Public Schools – Cody Elementary School Drainage – Millard Public Schools will install 2 rain gardens and an infiltration trench to address drainage issues while providing outdoor classroom space for students. They are requesting a cost-share amount of \$8,510.

Bennington Public Schools – Wetland Restoration Project – Bennington Public Schools will convert a cornfield on their property located adjacent to Big Papillion Creek to a wetland and outdoor learning environment. They are requesting a cost share of \$10,000, the maximum of this program.

City of South Sioux City – Cardinal Park Rain Garden – The City of South Sioux City will install a rain garden in Cardinal Park. They are requesting a cost-share amount of \$6,778.

The FY 2010 budget for this program was \$33,290.

Project Name	Total Project Cost	Cost Share Requested
Benson Rain Garden Initiative	\$55,000	\$10,000
Orchard Park Bio-Retention Garden	\$41,000	\$10,000
Pervious Pavement Bridge Embankments	\$35,400	\$10,000
Johnny Goodman Golf Course Bio-Retention Garden	\$29,000	\$10,000
Cody Elementary School Drainage	\$17,020	\$8,510
Wetland Restoration Project	\$52,500	\$10,000
Cardinal Park Rain Garden	\$13,555	\$6,778
Total	\$243,475	\$65,288

- Staff recommends that the Subcommittee recommend to the Board of Directors that the District approve the Benson Rain Garden Initiative application for \$10,000, the Orchard Park Bio-Retention Garden application for \$10,000, the Pervious Pavement Bridge Embankments application for \$10,000, the Johnny Goodman Golf Course Bio-Retention Garden application for \$10,000, the Cody Elementary School Drainage application for \$8,510, the Wetland Restoration Project application for \$10,000, and the Cardinal Park Rain Garden application for \$6,778, a total of \$65,288 for District Program 17.41, Stormwater BMP Program, subject to funding the in Fiscal Year 2011 budget.

City of Omaha

An aerial photograph of a residential and commercial area. The map is overlaid with a green grid representing property lines. A red star marks the location of 5120 Maple St, which is highlighted in yellow. To the west of this location is a large, light-colored building complex, possibly a school or government building, with a baseball field and other sports facilities. To the east is a dense residential neighborhood with many small houses. Streets labeled include Pinkney St, Emmet St, Bedford Ave, N 51st St, N 52nd St, N 53rd St, N 54th St, N 55th St, Spencer St, Gretchen Ave, Wirt St, N 50th Ave, N 50th St, Binney St, Maple St, Corby St, Miami St, NW Radial Hwy, and Country Club Ave. The baseball field has 'OMAHA' and 'BERNARD' written on it.

Living Green: Benson Raingarden Initiative
P-MRNRD Stormwater BMP Program
Statement of BMP Incorporation

The exclusive focus and purpose of the proposed project is centered on the construction of a bio-infiltration garden on the Benson Magnet High School Campus. The project has been a public awareness and student educational process between the City of Omaha, Omaha Public Schools, and Community ReDesigned as design consultant.

A pair of bio-infiltration gardens shall be constructed adjacent to the faculty parking area and will be sized to infiltrate, at a minimum, the ½" 'first flush' from the contributing watershed. Transference of water from the parking area to the gardens will be achieved from two drainage ways via both curb cut to vegetated swale and permeable pavers filtering and discharging into the gardens.

Upon completion, the gardens are intended to be utilized for classroom experiments and activities by faculty and students. Additionally they are to serve as a community awareness example to further educate achievable stormwater management opportunities at the single property owner scale.

17.41 STORMWATER BEST MANAGEMENT PRACTICES PROGRAM

SPECIAL PROJECT REQUEST APPLICATION

1. DATE: 3/16/10

2. PROJECT NAME: Orchard Park Bioretention Gardens (tennis courts)

3. PROJECT SPONSOR: City of Omaha Public Works

ADDRESS: 5600 So 10th Street
Omaha, NE 68107

4. CONTACT PERSON: Nina Cudahy

TITLE: Quality Control Manager

5. EMAIL AND PHONE: ncudahy@ci.omaha.ne.us
444-3915 x 229

6. PROJECT LOCATION: Orchard Park, 66th Street south of Hartman Ave, bioretention gardens are on the east side of the tennis courts.

7. DESCRIPTION OF STORMWATER BEST MANAGEMENT PRACTICE AND HOW IT WILL BE INCORPORATED IN THE PROJECT:

Bioretention gardens will be located just east of the tennis courts in Orchard Park. Prior to the stream restoration project in this part of Orchard Park, there was significant stream bank erosion that was close to undermining the tennis courts. The gardens are planned to take stormwater that sheet flows off of the tennis courts and from the surrounding drainage area and allow the water to infiltrate. This will help to reduce the erosive flows into Cole Creek, protect the bank that was recently re-graded, and provide water quality treatment. The bioretention gardens are sized to treat the water quality control volume (the first ½ inch of runoff) and allow the larger storm events to discharge through an underdrain into Cole Creek. The bioretention gardens are one of the stormwater best management practices implemented in the Cole Creek Restoration Project. Plans and the contractors bid price are attached.

9. TOTAL ESTIMATED COST: \$ 41,000

10. COST SHARE REQUESTED: \$ 10,000

11. SIGNATURE/TITLE: Nma Cardahy, Quality Control Manager

17.41 STORMWATER BEST MANAGEMENT PRACTICES PROGRAM

SPECIAL PROJECT REQUEST APPLICATION

1. DATE: 3/12/10
2. PROJECT NAME: JOHNNY GOODMAN GOLF COURSE STORMWATER MANAGEMENT
3. PROJECT SPONSOR: CITY OF OMAHA PUBLIC WORKS
- ADDRESS: 5600 S 10TH ST
OMAHA NE. 68107
4. CONTACT PERSON: SELMA KESSLER
- TITLE: CET
5. EMAIL AND PHONE: SELMA.KESSLER@CI.OMAHA.NE.US

6. PROJECT LOCATION:

JOHNNY GOODMAN GOLF COURSE
6111 S 99TH ST, OMAHA, NE 68127

7. DESCRIPTION OF STORMWATER BEST MANAGEMENT PRACTICE AND HOW IT WILL BE INCORPORATED IN THE PROJECT:

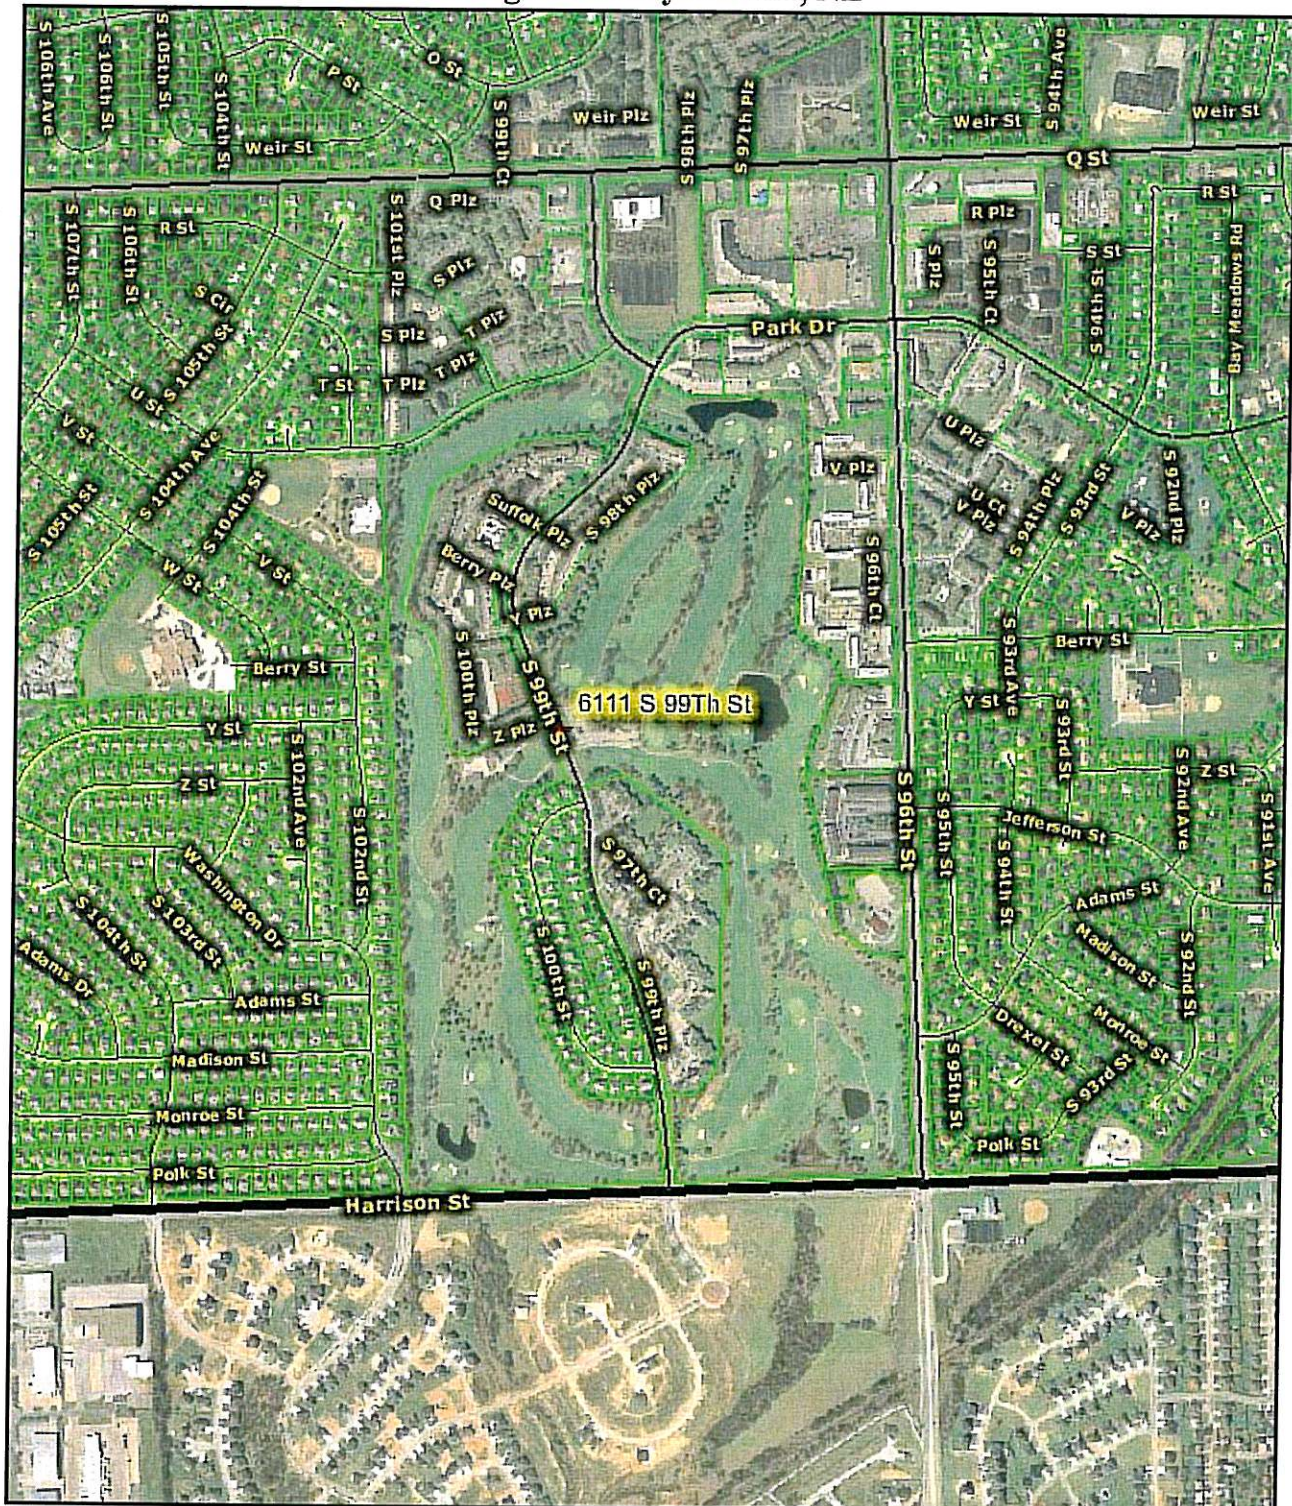

AREAS DAMAGED BY STORMWATER RUNOFF WILL BE REPAIRED AND GRADED TO ACCOMMODATE A RAEN/BIORETENTION GARDEN.

THIS REQUEST PERTAINS TO AREA 3 REFERENCED IN ATTACHED DRAINAGE STUDY.

ADDITIONAL BACKGROUND PROVIDED ON ATTACHED SUMMARY SHEET.

9. TOTAL ESTIMATED COST: \$ 29,000
10. COST SHARE REQUESTED: \$ 10,000

Proposed Solution (Additional Information)

The proposed solution for the damage to the golf course involves a combination of regrading the site to create bioretention areas with appropriate plants, reinforcing the soil at the point where stormwater flows on to City property, and slope stabilization along the overflow areas.

There are a total of 4 impact points where storm water is discharged directly on to the golf course. The municipal code no longer allows this practice; however, damage has occurred and the damaged areas are continuing to degrade. This particular project was brought to the Public Works Department's attention when a contractor applied for a plumbing permit for a project at the Cimarron Hill's Apartment complex. The permit dealt with discharging a new storm sewer installed to pick up roof drains onto the golf course.

The City coordinated with the engineer for Cimarron Hills, E&A Consulting, to develop a series of detention/infiltration basins and drop structures at the apartment complex in lieu of discharging directly on to the golf course, and this work was completed in August, 2009. The work done by the apartment complex should mitigate both the volume and velocity of runoff, but stormwater still discharges onto City property, the existing damage needs to be repaired and the potential for additional damage remains.

The City followed up with E&A with a contract to develop additional survey and drainage data for all discharge points. The funds requested with this application will be directed toward the damage repair and long term management of stormwater runoff at impact point 3. The drainage report and detailed topo data at all discharge points studied is included as an attachment with this submittal.

The estimated volume of each bioretention/rain garden is based on the City's standard of treating the first ½" of runoff from the contributing drainage area. The corresponding surface area is based on an assumed maximum depth of 0.5 ft. The estimated construction cost is \$5/sq ft. Table 1 summarizes the estimated volume, area and cost of bioretention gardens at impact point 3.

Table 1

	Contributing Area, Acres	Volume, Ft ³ (based on ½" runoff)	Garden Area, Ft ² (0.5' depth)	Estimated Cost (\$5/ft ²)
Area 3	1.6	2904	5808	\$29,040
Total Estimated Cost				\$29,040

17.41 STORMWATER BEST MANAGEMENT PRACTICES PROGRAM

SPECIAL PROJECT REQUEST APPLICATION

1. DATE: 3-12-2010

2. PROJECT NAME: Pervious Pavement Bridge Embankments

3. PROJECT SPONSOR: City of Omaha Parks Recreation and Public Property

ADDRESS: 18 19 Farnam Street, Suite 701
Omaha Nebraska 68183

4. CONTACT PERSON: Barbara Kohles

TITLE: Park Planner

5. EMAIL AND PHONE: bkohles1@ci.omaha.ne.us 402-444-5943

MAR 16 2010

6. PROJECT LOCATION:

First, the proposed pervious concrete bridge embankment will be located at West Papio creek Trail and the Blondo Street Bridge at approximately 162nd Street, Omaha Nebraska. Second, the proposed pervious concrete bridge embankment will be located at Big Papio creek Trail and the 105th Street Bridge, near Pacific Street.

7. DESCRIPTION OF STORMWATER BEST MANAGEMENT PRACTICE AND HOW IT WILL BE INCORPORATED IN THE PROJECT:

The storm water Best Management Practices will be a 50' x 15' pervious concrete slab on the high or east side of the trail under the Blondo Street Bridge. The 105th street bridge pervious concrete slab will be 50'x 50' on the high side or east side of the trail. The concrete slab will be large enough to cover the bare soil and 5' beyond to catch water coming from the surrounding surfaces. There will be a 36" bed of aggregate, on filter fabric, under the concrete, for the water to flow to a low point adjacent to the trail. There the water will be caught and piped under the trail, down the slope to the creek. The pipe will be braced in the typical Natural Resource District method at the creek edge.

Currently, there is bare soil eroding away. The source of the erosion is from:

- The car sloshing water over the sides of the bridge,
- Wind swept rain hitting the sides of the bridge and retaining walls then running down the embankment,
- 4 drain and seep holes releasing water on to the embankment
- Normal overland rain flowing down the embankment
- Wind erosion
- Rain from the bridge surface and sidewalks

9. TOTAL ESTIMATED COST: \$35,400.00

10. COST SHARE REQUESTED: \$10,000.00.

6. PROJECT LOCATION:

Cody Elementary School
3320 S. 127th Street
Omaha, NE 68144

7. DESCRIPTION OF STORMWATER BEST MANAGEMENT PRACTICE AND HOW IT WILL BE INCORPORATED IN THE PROJECT:

During the planning phase for the parking lot renovation at Cody Elementary School, drainage issues were discovered. After consulting with an engineer, Millard Public Schools (MPS) decided to address the the issues utilizing environmentally sound practices that would also provide outdoor classroom areas for more than 210 students annually, 65% of whom are from low income families. The outdoor classroom areas include two rain gardens and an infiltration trench that in addition to benefiting the students will slow and filter stormwater runoff.

9. TOTAL ESTIMATED COST: \$ 17,020

10. COST SHARE REQUESTED: \$ 8,510

Millard Public Schools
Cody Stormwater Best Management Practices Program

The Millard Public Schools Board of Education has given approval to renovate the parking lot at Cody Elementary School during the summer of 2010. Olson and Associates estimates the total cost of the project at \$355,000. The Stormwater Best Storm Management Practices grant request by Millard Pubic Schools is for eligible costs associated with the construction of two rain gardens and an infiltration trench described on the preceding page. Cost estimates are indicted below.

Excavation	400
Retaining wall	8,400
Scour Stop erosion control at pipe outlet	450
Native plants	4,270
Permeable soil mix	<u>3,500</u>
Total Eligible Costs	\$17,020

Project Information

Date: March 10, 2010

Project Name: Wetland Restoration and Education Project

Project Sponsor: Bennington Public Schools

City ST ZIP Code: Bennington, NE 68007

Contact Person/Title: Kate Schumacher, Science Teacher

E-Mail/Phone: cschumacher@esu3.org 402-238-2447

Project Location: On Bennington Public Schools property located at 168th Street and Bennington Road, Bennington, NE. The wetland would be located adjacent to the main channel of the Papio Creek.

Project Description: To convert a monoculture cornfield into a wetland and outdoor learning environment. Adding a wetland would increase the species diversity for wildlife and vegetation. To collect water for the wetland we would use precipitation as well as collecting storm water runoff from the road ditch on 168th St. The wetland vegetation will help to maintain water quality and soil health by filtering out pollutants and preventing sedimentation.

Cost Estimate

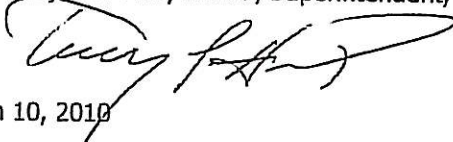

Total Estimated Cost: \$52,500

Cost Share Requested: \$10,000

Agreement and Signature

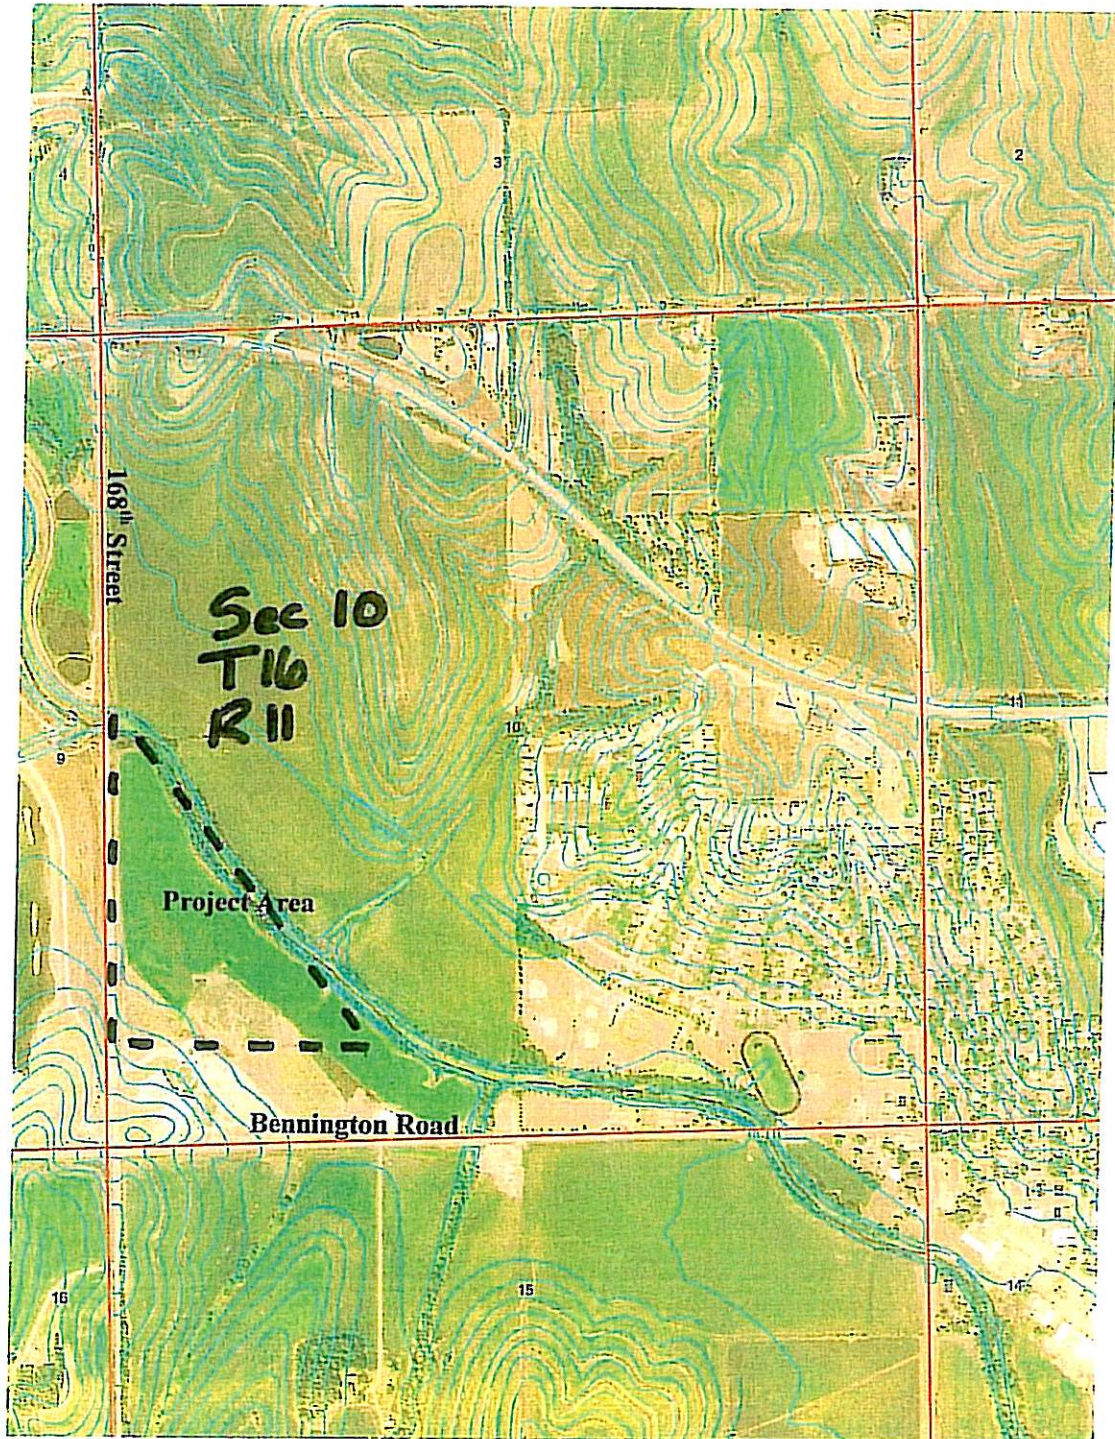

Name (printed): Dr. Terry Haack, Superintendent, Bennington Public Schools

Signature:

A handwritten signature in black ink, appearing to read "Terry Haack", is written over a horizontal line.

Date: March 10, 2010

Project Location

Budget:

Budget Category	Budget Amount
Engineering and Project Management	7,000
Earthwork	19,000
Vegetation	20,000
Structures	5,000
Maintenance	1,500
TOTAL	52,500

Schedule:

Month/Year	Task Description:
April 2010	Contact engineers to assess the site and begin engineering and layout plans
May 2010	Begin construction of wetland, plant vegetation, work on trail and observation docks
June 2010 – July 2010	Project to be completed (depending on weather). Work with science teachers to create new curriculum to reflect environmental aspects of the project. Start initial species population study. Publicize project, conduct tours and public information seminars about the project.
August 2010	Monitor maintenance
September 2010	Monitor maintenance
October 2010	Develop a program for maintenance
November – March 2011	Monitor the site for potential problems and issues.
April 2011	Perform maintenance tasks as needed

Construction and Design of the Wetland

The project site for the 2-acre wetland and outdoor classroom is on school property located at the intersection of 168th Street and Bennington Rd, Bennington, NE and is part of the Papio Creek Watershed. The construction of the actual wetland for our site would be a surface water depression. This type of wetland results from water pooling in a shallow basin. The hydrology depends on natural precipitation and overland water flow.

To collect water for the wetland we would use precipitation as well as the storm water runoff from the road ditch on 168th Street. The storm water runoff comes from an agricultural area draining about 30 acres south of Bennington Road. It flows through the road ditch along 168th Street. Although there aren't any discharge records for the flow in this ditch, observations by the Bennington High School staff indicate that significant water is collected by the ditch during heavy rainfall and snowmelt. The natural flow in the ditch would be diverted to our proposed wetland by building a weir in the ditch and redirecting some of the flow into a 200-foot long and 4-foot wide diversion channel connected to the wetland.

This wetland would be constructed so that even in drought conditions it would still have some water pooling in the basin. The shallow water area would be created by excavating soil to the appropriate elevation and placing the fill material to create berms. The overall size for our wetland, based on hydrology, would be about two acres. The depth for our wetland would be about 3-4 ft. To maintain a pool of water, berms and a water control structure would be installed as well as to allow for future maintenance of the wetland.

Structures

For student experiments and easy access to the actual wetland site, we would construct observation docks. These would be low to the ground to allow accessibility to visitors of all physical abilities to the water and vegetation. These docks would be 8-foot wide by 45-foot long and would be constructed out of recycled plastic lumber with concrete footings. All of the physical structures would be designed to meet ADA standards.

Vegetation

Wetlands support a variety of vegetation specific to their physiology. Wetland vegetation is grouped into two general ecological categories, dependent mainly on growth position in relation to water level. Naturally, water levels tend to vary in wetlands due to seasonal rains and other climatic conditions. While some wetland plants can easily adapt to changes in soil moisture and water level, others have strict water requirements for survival. Thus, the following groups represent only a general guide to typical wetland plant habitats.

Wetland Edge – plants that grow in wet soil on the shorelines at or above water level; some may be rooted in shallow water.

Emergent – plants that are rooted in soil that is completely underwater, much of the body is underwater.

The purpose of wetland vegetation is to maintain water quality and soil health by filtering out pollutants and preventing sedimentation. Another benefit of plants is that they provide food, shelter, and breeding habitat for both aquatic and terrestrial fauna. In addition, they help prevent erosion.

To create a naturalized look around the wetland, we plan to grow successive layers of vegetation. Next to the natural wetland plants, prairie grasses, shrubs, and an arboretum will be implemented. There will be a focus on native and well-adapted plants, demonstrating native plant conservation
